Historical: No information at present

Shown as building 2208 on a September, 1944 map of the base, this unusual structure has the appearance of a double building. That is, it looks like two, individually built structures pushed together and joined along their broadsides. Each side has its own gabled roof, causing roof water to run into a common valley where the two roofs connect. This is considered an inadvisable roofing design because it allows water to penetrate the interior of the building. In fact, significant water damage exists along the exterior walls at the ends of the roof valley. Despite these factors, the building seems to have been originally built as it now stands. The 1944 map shows it, including the triangular loading/dock adjacent to the railroad spur in its present configuration.

Sometimes called building 2204, it has elevated concrete foundation walls, wood frame construction with drop-lap wood siding, and a gabled roof. The siding is broken into 4-foot to 8-foot panels by exposed wall studs, an unusual feature not found elsewhere on the base. The gabled roofs have asphalt roll siding. The windows are 9-paned units, with panes of 6-pane units in the upper gable ends. A five-step concrete stairs leads to a paneled door on the east end. Roughly half of the roofing has blown off, but the buildings seem to be structurally sound.
